

Surge Suppression Stage I / External:

The meter-based service entrance device provides heavy duty protection and reduces or eliminates a power surge or "spike" on the electric line before it enters your home. This device is mounted between the meter and meter socket, providing surge suppression for your household and protecting your motor driven appliances.

Stage I protection includes:

- The heating and AC unit (heat pump)
- Washer & dryer
- Electric range and cooktop
- Refrigerator/freezers
- Dishwasher
- Electric breaker panel
- Pumps within the house
- The electronic controls for all of the above

The meter collar is equipped with an indicator light that lets you verify that the suppressor is operational and doing its job. Your appliances are protected and you can think about other things.
