

Surge Suppression Stage II / Internal *What Do the Lights Mean?*

The wall mount and power strip point of use surge suppression devices CVEC provides have indicator lights on them. Most have two lights:

1. One light indicates that the device is operational and is protecting

properly.

2. The other light indicates that the device has an active ground connection. This is important when determining if the device has sustained a surge, or if it simply

isn't plugged in properly.

If any of these lights indicate that the device is not working properly the member should contact CVEC for more help.
